

The Good Times!

A Very Special Band for your very special occasion

Technical Requirements & Information

The Good Times band equipment set comprises the following items:

- Public Address system suitable for most venues from small function rooms to medium size halls.
- A "backline" comprising guitar & bass amplifiers, plus electronic keyboards, onstage sound monitoring speakers.
- A DMX lighting rig plus free standing floor spotlights.
- All equipment Portable Appliance Tested. We carry PAT & PLI certificates/schedules.

Power Consumption

- The typical, total power consumption requirements for this equipment are approximately 5000 watts (this may vary according to the size of the venue & the equipment configuration on the night).
- We require a minimum of 3 separate 13 Amp wall mains sockets (preferably 4) for safe operation in order to spread the electrical load.
- If a venue has limited sockets, we will assess before setting up & will reduce power consumption by operating at lower volume and/or using less lighting.

We therefore advise you to confirm what power supplies are available in the venue before the event (and whether the event venue has its own stage lights which can be used). You can always give us a contact at the venue to talk to if you wish!

Setup configuration and pre-performance time allowances

- The band does not require offstage mixing – all equipment is run from the stage. We're a 5-piece band so require a "civilised" stage space! Just imagine a drum kit with enough space on each side for a person holding a guitar... and enough space at the front for a keyboard and a singer.
- Our pre-performance setup time including sound checks is approx. 1 hour.
